Katalin Bálint submission of 20 June 2017

I would like to send my story about psychiatrist medicines.

Two years ago I got mirtazapine because I had anxiety. The reaction was terrible.

I lost my emotions, my sexuality, my memory, so I could not orient. 1 month later, I stopped it. For 1.5 Years symptoms are terrible (no long- and short- term memory, emotions, sexuality, planning, learning ability, concentration, perception and executive functions are impaired. I cannot orient, my mind is blank, etc). So, I tried suicide a lot. I feel that my brain is damaged forever. But I wish I would heal.

Before the pills, I was a very active girl with a lot of friends. I learnt, worked, and plan own family. Now, I live like a zombie with amnesia and anhedonia. I'm vegetative, my brain can't think. Million people get similar symptoms because these drugs.

Thank you for your help.
